

Spanish Flashcards - Streamlit app

Safe checklist for adding many CSV files without breaking the app:

1. Put every new deck in the existing `csv` folder.
2. Make sure every file ends with `.csv`.

Good examples:

`food.csv`

`travel_phrases.csv`

`verbs_past_tense.csv`

3. Make sure every CSV uses the same two headers:

```
word,answer
```

4. Make sure the first row is the header row.

```
word,answer
apple,manzana
dog,perro
```

5. Do not use different column names like:

`english,spanish`

`prompt,response`

`front,back`

The current app expects exactly:

`word`

`answer`

6. Avoid blank rows at the bottom of the file.
Blank rows can create messy or empty cards.
7. Avoid duplicate filenames.
Each deck file should have its own unique name.

8. Use simple filenames.

Best practice:

animals.csv

food.csv

travel.csv

household_words.csv

9. After copying in new CSVs, test locally with:

```
streamlit run streamlit_eng_sp_flashcards.py
```

10. Verify three things in the app:

11. the new files appear in the deck picker

12. the picker is alphabetized

13. opening a few decks actually shows the expected cards

14. Then push the new files to GitHub:

```
git add .  
git commit -m "Add new flashcard decks"  
git push
```

12. Wait for Streamlit Cloud to redeploy.

Then test the live app too.

Practical batch workflow for 30 to 40 files:

- Copy all new CSVs into the csv folder.
- Open 2 or 3 of them and confirm the headers are word,answer .
- Run the app locally.
- Confirm the new decks appear alphabetically.
- Commit and push.

One thing to watch:

If even one CSV has the wrong columns, the app can fail when that deck is selected, because this code reads:

```
row["word"]  
row["answer"]
```

So consistency across files matters.

If you want, I can do one more improvement next:

- add validation so the app shows a friendly error when a CSV has the wrong columns instead of crashing
- make deck names prettier in the dropdown, for example turning `travel_phrases.csv` into `Travel Phrases`
